OpenVINO Toolkit & Process Introduction

1.1 About the Guide

The OpenVINO (Open Visual Inference and Neural Network Optimization) development guide covers the workflow, Lab guide of OpenVINO Toolkit. The guide shows users how to deploy applications and solutions that emulate human vision with Intel OpenVINO Toolkit. It implements the CNN-based deep learning by using heterogeneous execution acceleration. With the easy-to-use functions library for computer vision, the OpenVINO Toolkit speeds up time-to-market for the products. This guide also shows users how to quickly setup the CNN-based deep learning applications running on FPGA.

This guide is created based on Terasic [Starter Platform for OpenVINO™ Toolkit](#), user also can refer to this guide for [DE5a-Net-DDR4](#) and [DE5a-Net](#) boards OpenVINO development, it includes the following contents:

- OpenVINO Toolkit Introduction
- OpenVINO Workflow
- Model Optimizer and Inference Engine
- Run demo on the Starter Platform for OpenVINO™ Toolkit
- Starter Platform for OpenVINO™ Toolkit Lab

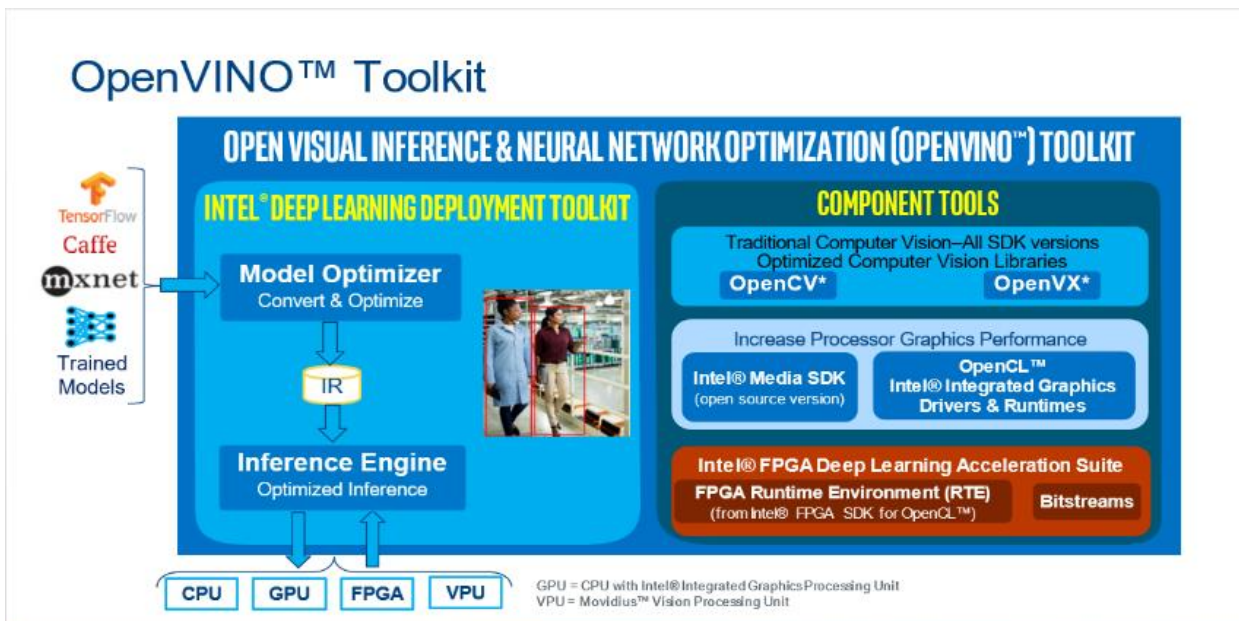

1.2 OpenVINO Toolkit Features

OpenVINO (Open Visual Inference and Neural Network Optimization) Toolkit can improve the performance of the Computer Vision, and shorten the time taken for product to market. It can help user to take the advantages of Terasic FPGA boards easily, including improving performance, reducing power consumption and significantly improving FPGA utilization. Users can achieve double efficiency with half effort and open new design possibilities. The main features are:

- Enable CNN-based deep learning inference on the edge
- Support heterogeneous execution across Intel's CV accelerators, using a common API for the CPU, Intel® Integrated Graphics, Intel® Movidius™ Neural Compute Stick, and FPGA
- Speed up time-to-market through an easy-to-use library of CV functions and pre-optimized kernels
- Include optimized calls for CV standards, including OpenCV*, OpenCL™, and OpenVX*

1.3 What's Inside OpenVINO Toolkit

OpenVINO Toolkit uses a common API, which is based on the general development standards such as OpenCL, OpenCV and OpenVX.

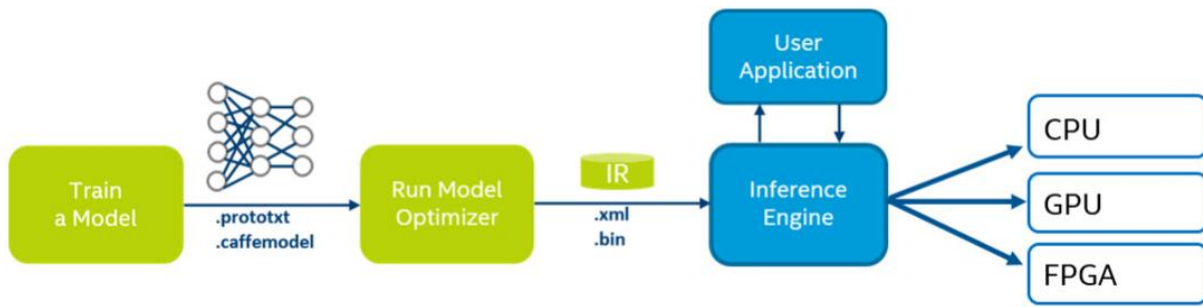

The Toolkit includes:

1. Deep Learning Deployment Toolkit, which comprises the following two components:
 - Model Optimizer: This Python*-based command line tool imports trained models from popular deep learning frameworks such as Caffe, TensorFlow, and Apache MXNet*. Input trained model, optimize topology, and convert it to an IR (IR, Intermediate Representation) file.
 - Inference Engine: This execution engine uses a common API to deliver inference solutions on the platform of your choice: CPU, GPU, VPU, or FPGA to work on heterogeneous processing and asynchronous execution to save the development time.
2. Optimized computer vision library for OpenCV, OpenVX, and image vision for CPU and GPU.
3. The improved performance of Intel processor graphics card components in Linux, including Intel Media SDK open source version, OpenCL graphics driver, and runtime environment.
4. The runtime environment (RTE) supports running OpenCL on FPGA and bitstreams for configuring FPGA.

1.4 OpenVINO Workflow

The steps for OpenVINO optimizing and deploying a trained model are:

1. Configure the Model Optimizer for your framework.
2. Convert a trained model to produce an optimized Intermediate Representation (IR) of the model based on the trained network topology, weights, and biases values.
3. Test the model in the Intermediate Representation format using the Inference Engine in the target environment by the Validation application or the sample applications.
4. Integrate the Inference Engine in your application to deploy the model in the target environment.

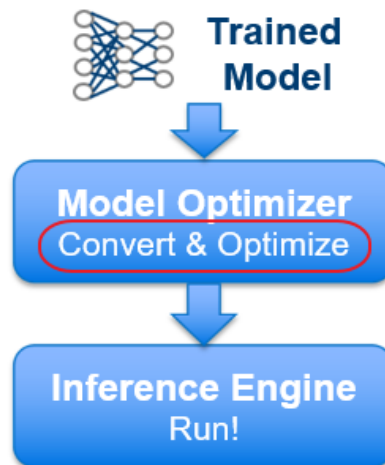

1.5 Model Optimizer

Model Optimizer is a cross-platform command-line tool that facilitates the transition between the training and deployment environment, performs static model analysis, and adjusts deep learning models for optimal execution on end-point target devices.

Model Optimizer produces an OpenVINO supported framework as a trained model input and an Intermediate Representation (IR) of the network as output. Intermediate Representation is a pair of files that describe the whole model:

- .xml: Describes the network topology
- .bin: Contains the weights and biases binary data

■ How the Model Optimizer Works

Model Optimizer loads a model into memory, followed by reading it and building the internal representation of the model. The Model Optimizer then optimizes it and produces the Intermediate Representation. The Intermediate Representation is the only format the Inference Engine accepts. Model Optimizer has two main purposes:

- 1) Produce a valid Intermediate Representation.

If this main conversion artifact is not valid, the Inference Engine cannot run. The primary responsibility of the Model Optimizer is to produce the two files that form the Intermediate Representation.

- 2) Produce an optimized Intermediate Representation.

Pre-trained models contain layers that are important for training such as the dropout layer. These layers are useless during inference and might increase the inference time.

In many cases, these layers can be automatically removed from the resulting Intermediate Representation. However, if a group of layers can be represented as one mathematical operation and thus a single layer, the Model Optimizer recognizes such patterns and replaces these layers with one layer. The result is an Intermediate Representation that has fewer layers than the original model. This reduces the inference time.

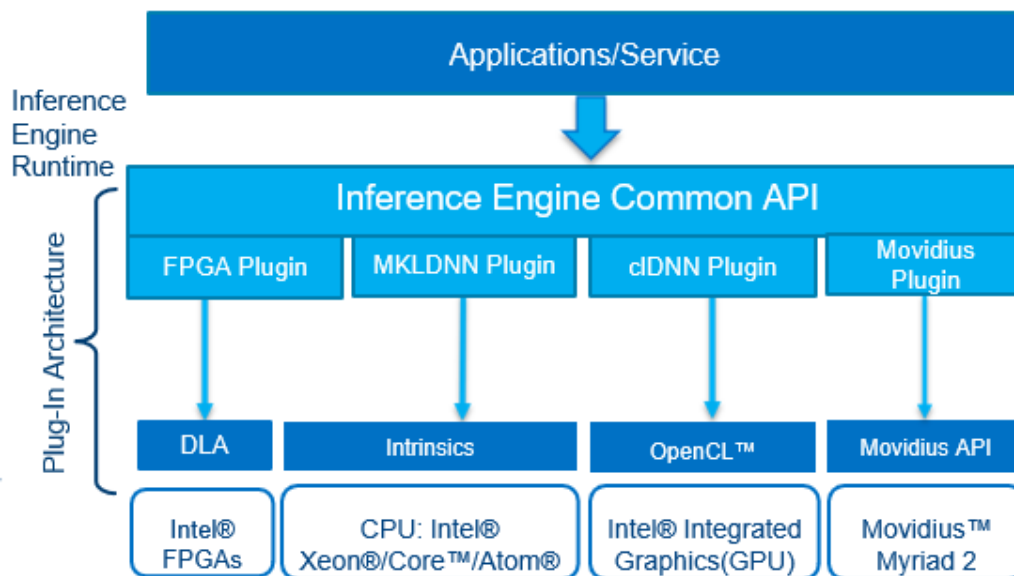

Many common layers exist across known frameworks and neural network topologies. Examples of these layers are Convolution, Pooling, and Activation. The Model Optimizer must be able to work with these layers to read the original model and produce the Intermediate Representation of a model, the layer list varies by framework. Please refer to the documentation of the Caffe*, TensorFlow* and MXNet* for the topologies supported by each of these frameworks. If your topology contains only layers from the list of layers, which is the case for the topologies used by most users, the Model Optimizer can easily create the Intermediate Representation. Users can proceed to work with the Inference Engine afterwards.

However, if you use a topology with layers that are not recognized by the Model Optimizer, please refer to Custom Layers in the Model Optimizer to learn how to work with custom layers.

1.6 Inference Engine

After an Intermediate Representation is created by the Model Optimizer, input data can be inferred by the Inference Engine.

The Inference Engine is a C++ library with a set of C++ classes to infer input data (images) and get a result. The C++ library provides an API to read the Intermediate Representation, set the input and output formats, and execute the model on devices.

Each supported target device has a plugin and each plugin is a DLL/shared library. The Heterogeneous plugin lets you distribute a calculation workload across devices. One needs to make sure those libraries are specified in the path of host PC or in the place pointed to the plugin loader. Additionally, the related library for each plugin must be included in the LD_LIBRARY_PATH. When the Inference Engine calls the FPGA-based DLA plug-in, the DLA runtime software layer is called to use the DLA API. These

APIs are converted to the corresponding modules executed on the FPGA device. This part would be executed in different levels of in-depth learning networks.

Common Workflow for Using the Inference Engine API:

1. **Read the Intermediate Representation:**
Use the `InferenceEngine::CNNNetReader` class and read an Intermediate Representation file into a `CNNNetwork` class. This class represents the network in host memory.
2. **Prepare inputs and outputs formats:**
After loading the network, specify input and output precision, and the layout on the network using `CNNNetwork::getInputInfo()` and `CNNNetwork::getOutputInfo()`.
3. **Select Plugin:**
Select the plugin to load your network. Create the plugin with the `InferenceEngine::PluginDispatcher` load helper class. Pass per device loading configurations specific to this device and register extensions to this device.
4. **Compile and Load:**
Use the plugin interface wrapper class `InferenceEngine::InferencePlugin` to call the `LoadNetwork()` API to compile and load the network on the device. Pass in the per-target load configuration for this compilation and load operation.
5. **Set input data:**
There's an `ExecutableNetwork` object with the network loaded.

Use this object to create an `InferRequest` in which you signal the input buffers to use for input and output. Specify a device-allocated memory and copy it into the device memory directly or tell the device to use your application memory to save a copy.
6. **Execute:**
Choose the execution mode with the input and output memory defined:

Synchronously - `Infer()` method. Block until inference finishes.

Asynchronously - `StartAsync()` method. Check status with the `wait()` method (0 timeout), `wait`, or specify a completion callback.
7. **Get the output:**
Get the output memory or read the memory provided earlier after inference is complete.

This can be done with the `InferRequest GetBlob` API.

For more information about integrating the Inference Engine in your application, please refer to the [Inference Engine Developer Guide](#).

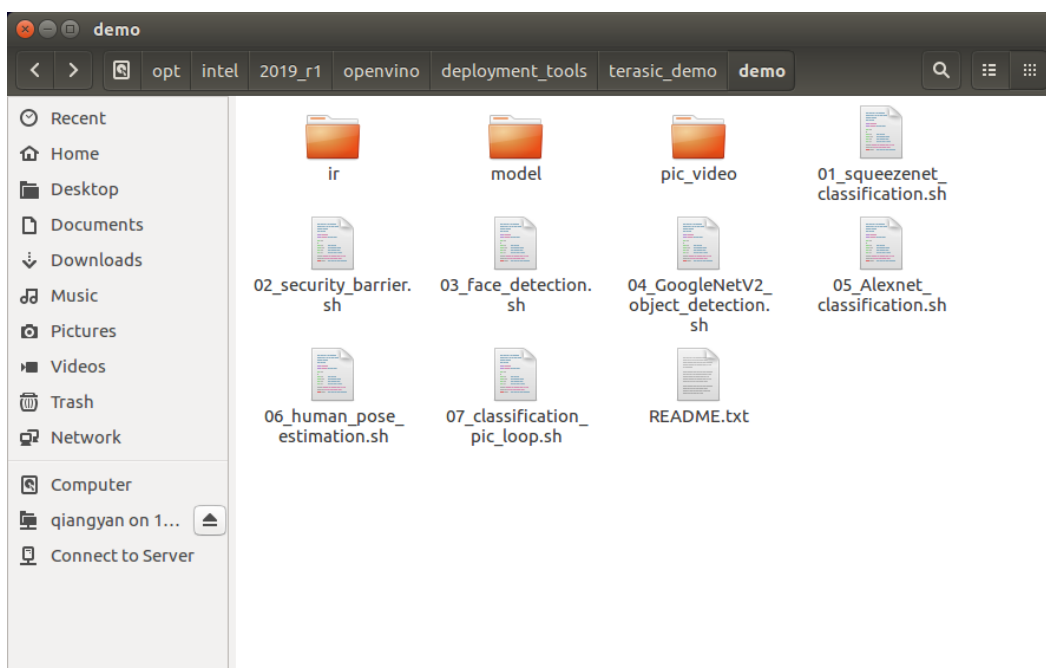

Chapter 2

Run the DEMO on the Starter Platform for OpenVINO™ Toolkit

This chapter describes how to run the demo on the Starter Platform for OpenVINO™ Toolkit and shows the execution result of the demo. Before running these demos, user needs to finish OpenVINO Development installation by referring to the manual “**OpenVINO_Installation_Guide**”.

2.1 Introduction

As shown in the figure below, there are some shell scripts in the terasic_demo/demo folder.

Below is the brief introduction of the demo folder.

1. How to use these Shell script files

Users can run any one of the shell script files with default parameters, and users can also use `cpu`, `vpu` or `fpga` to specify the target device to run the demo. There are also other parameters for using, users can run shell script file with `'-h'` for more details. And the default parameter is for `cpu`.

2. The images and video required by the demo are in the `pic_video` folder.

3. The Caffe model downloaded from internet is in the `model` folder.

- alexnet
- squeezenet1.1
- GoogleNetV2
- Users can add Caffe model by referring to the writing rule of the script. Please pay attention to the path and name.

- Please refer to OpenVINO-Using-TensorFlow to transfer the Tensorflow model

4. IR folder

While running the demo, the corresponding model IR file will be generated automatically if it's needed.

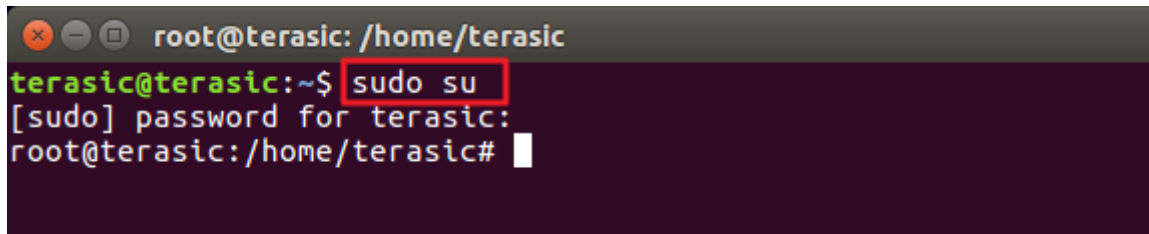

- The model generated under FP16 folder is used for FPGA
- The model generated under FP32 folder is used for CPU

2.2 Execute the Demo

There are seven demos included in the OpenVINO Toolkit. To run these demos, users need to open a terminal and type `sudo su`, source the setup script, and prepare the running environment.

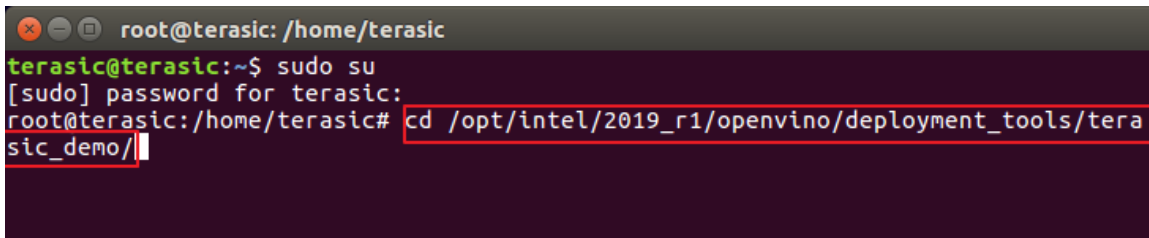

(login account: here, our username is terasic, password is terasic)

1. Right click on the desktop to open the Terminal, enter command "`sudo su`" to change user to root Super User, enter password "`terasic`"

```
root@terasic: /home/terasic
terasic@terasic:~$ sudo su
[sudo] password for terasic:
root@terasic: /home/terasic#
```

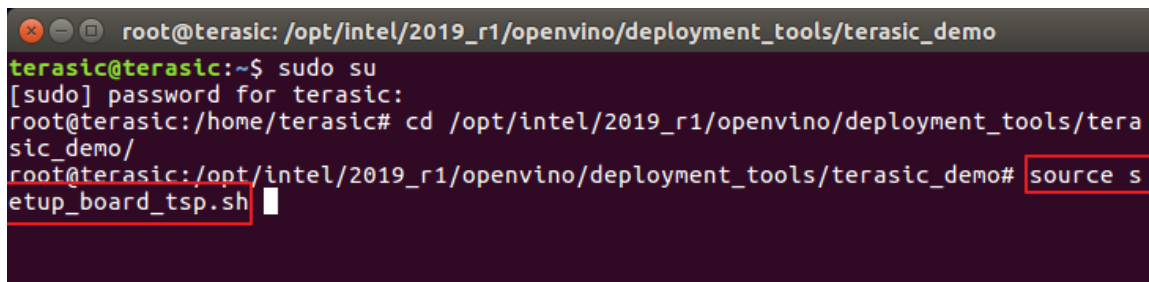

2. Enter "`cd /opt/intel/2019_r1/opencvino/deployment_tools/terasic_demo`" to switch to terasic_demo path.

```
root@terasic: /home/terasic
terasic@terasic:~$ sudo su
[sudo] password for terasic:
root@terasic: /home/terasic# cd /opt/intel/2019_r1/opencvino/deployment_tools/terasic_demo/
```

3. Source `setup_board_tsp.sh`

Note: User needs to setup the corresponding `.sh` file for the FPGA board, for example, source `setup_board_tsp.sh` for TSP GT Edition board or TSP GX Edition board, source `setup_board_de5a_net_ddr4.sh` for DE5a-Net-DDR4 board.

```
root@terasic: /opt/intel/2019_r1/opencvino/deployment_tools/terasic_demo
terasic@terasic:~$ sudo su
[sudo] password for terasic:
root@terasic: /home/terasic# cd /opt/intel/2019_r1/opencvino/deployment_tools/terasic_demo/
root@terasic: /opt/intel/2019_r1/opencvino/deployment_tools/terasic_demo# source setup_board_tsp.sh
```

4. Type “y” to install.

```

root@terasic:/opt/intel/2019_r1/opencvino/deployment_tools/terasic_demo# source setup_board_tsp.sh
[setupvars.sh] OpenVINO environment initialized
INTELFPGAOCCLSDKROOT is set to /opt/altera/aocl-pro-rte/aclrte-linux64. Using that.

aoc was not found, but aocl was found. Assuming only RTE is installed.

AOCL_BOARD_PACKAGE_ROOT is set to /opt/altera/aocl-pro-rte/aclrte-linux64/board/ask. Using that.
Adding /opt/altera/aocl-pro-rte/aclrte-linux64/bin to PATH
Adding /opt/altera/aocl-pro-rte/aclrte-linux64/host/linux64/lib to LD_LIBRARY_PATH
Adding /opt/altera/aocl-pro-rte/aclrte-linux64/board/tsp/linux64/lib to LD_LIBRARY_PATH
Do you want to install /opt/altera/aocl-pro-rte/aclrte-linux64/board/tsp? [y/n]
y

```

5. Enter *aocl diagnose* to check the environment, the “DIAGNOSTIC_PASSED” represents the environment setup is successful.

```

root@terasic:/opt/intel/2019_r1/opencvino/deployment_tools/terasic_demo
RY_PATH
root@terasic:/opt/intel/2019_r1/opencvino/deployment_tools/terasic_demo# aocl diagnose
-----

Demo completed successfully.

root@terasic:/opt/intel/2019_r1/opencvino/deployment_tools/terasic_demo/d
emo# ./06 human pose estimation.sh fpga

```

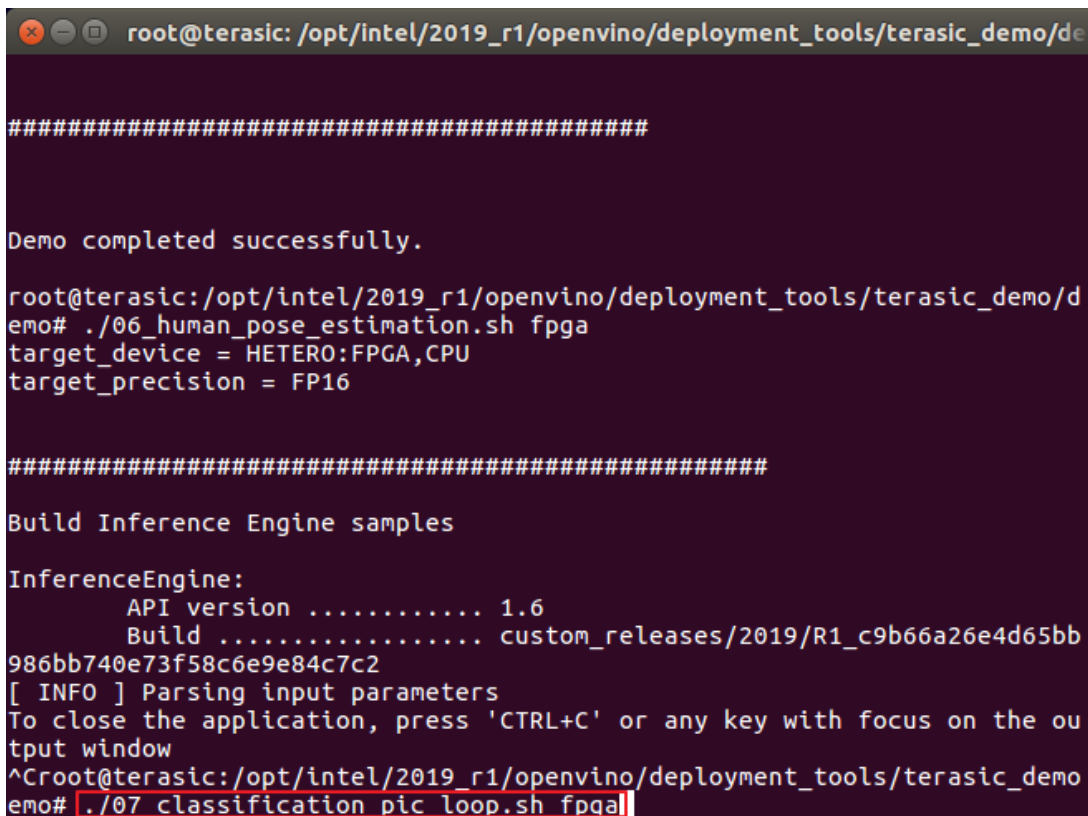

3) The result is shown in the figure below. Enter Ctrl+C to close the Application.

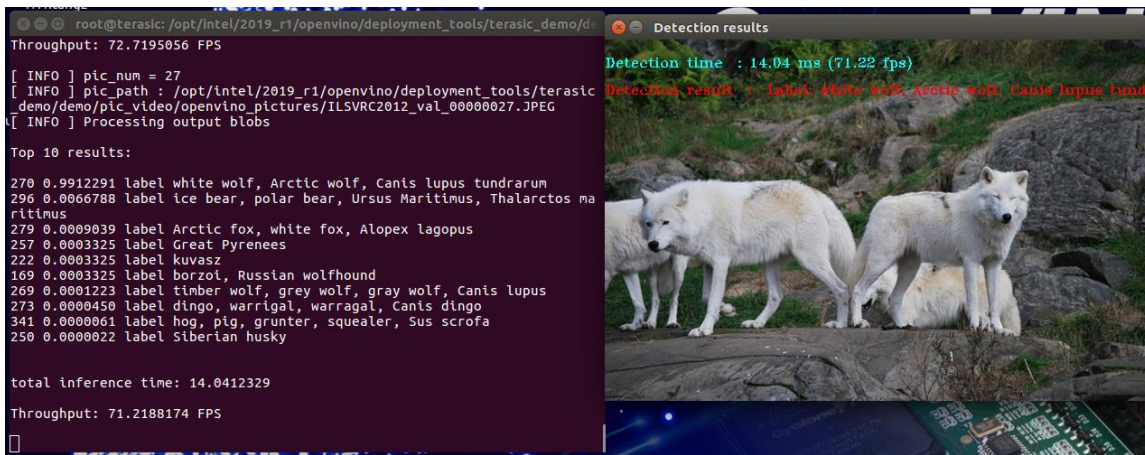

■ **07_classification_pic_loop**

This demo bases demo 01_squeezenet_classification, and adds more pictures to run in a loop.

1) Execute “./07_classification_pic_loop.sh fpga” to run the demo with FPGA.

2) The result is shown in the figure below.

Note: Some demos execution result will show the frame rate, the result of these demos is depending on the performance of user's PC CPU and the FPGA device. The CPU grade is higher (I7 instead of I5), the result is better if user executes the demo on the DE5a-Net-DDR4 instead of TSP.

Starter Platform for OpenVINO™ Toolkit Lab

This chapter describes how to verify the experiment environment, implement the acceleration of users own AI demonstrations on the FPGA platform.

3.1 Verify the Environment of the Experiment

This section will show user how to verify the environment of the experiment by running the demo “02_security_barrier.sh” with CPU which is provided in terasic demo.

1. Open a terminal by right clicking on the Desktop.
2. Enter command “*sudo su*” to change the user to the root Super User, the password is terasic.

```

root@terasic: /home/terasic
terasic@terasic:~$ sudo su
[sudo] password for terasic:
root@terasic: /home/terasic#

```

3. Enter “*cd /opt/intel/2019_r1/openvino/deployment_tools/terasic_demo*” to switch the path.

```

root@terasic: /home/terasic
terasic@terasic:~$ sudo su
[sudo] password for terasic:
root@terasic: /home/terasic# cd /opt/intel/2019_r1/openvino/deployment_tools/terasic_demo/

```

4. Enter “*source setup_board_tsp.sh*”.

Note: User needs to setup the corresponding .sh file for the FPGA board, for example, source *setup_board_tsp.sh* for TSP GT Edition board or TSP GX Edition board, source *setup_board_de5a_net_ddr4.sh* for DE5a-Net-DDR4 board.

```

root@terasic: /opt/intel/2019_r1/openvino/deployment_tools/terasic_demo
terasic@terasic:~$ sudo su
[sudo] password for terasic:
root@terasic: /home/terasic# cd /opt/intel/2019_r1/openvino/deployment_tools/terasic_demo/
root@terasic: /opt/intel/2019_r1/openvino/deployment_tools/terasic_demo# source setup_board_tsp.sh

```

5. Enter “y” for the driver installation.

```

root@terasic:/opt/intel/2019_r1/opencvino/deployment_tools/terasic_demo# source s
etup_board_tsp.sh
[setupvars.sh] OpenVINO environment initialized

```

13. The result of the Demo is as shown below.

3.2 Lab 1. How to use the Model Optimizer to transform the Model?

This section will show user how to use the Model Optimizer tool to get the IR parameters from pre-downloaded caffe model file “squeesenet1.1” which will be used by Inference Engine app.

1. Enter “`cd /opt/intel/2019_r1/opencvino/deployment_tools/terasic_demo/demo/model/caffe/`” to switch the path to the pre-downloaded Model folder.

```

For more information of Inference Engine API, user can refer to following link:

<https://docs.openvinotoolkit.org/latest/annotated.html>

https://docs.openvinotoolkit.org/latest/_docs_IE_DG_Integrate_with_customer_application_new_API.html

3.4 Lab 3. Execute the created application file, use the Inference Engine for the classification predication.

1. In the previous steps, we have transformed the model to the IR files which are used by the inference engine, and generated the corresponding executable file. Before executing the file, let's have a general understanding of the operations in the application program.
2. Open the file: classification_sample.h, there is a parameter "showUsage" for executing the app, -h

is for help, -i is for the path to a folder with images or the camera parameters, -m is for the path of a trained Model (IR Path), -d is for the target device.

```

classification_sample.h [Read-Only] (/opt/intel/2019_r1/opencvino/deployment...e_engine/
Open Save

                data[image_id * image_size * num_channels + ch * image_size + pid] = imagesData.at(image_id).get()[pid*num_channels + ch];
            }
        }
    }
}
inputInfo = {};
// -----
```

- Step7, Do the inference, send data to FPGA for processing, and send the result to CPU.

```
// ----- 7. Do inference -----
slog::info << "Starting inference (" << FLAGS_ni << " iterations)" << slog::endl;

typedef std::chrono::high_resolution_clock Time;
typedef std::chrono::duration<double, std::ratio<1, 1000>> ms;
typedef std::chrono::duration<float> fsec;

double total = 0.0;
/** Start inference & calc performance */
for (int iter = 0; iter < FLAGS_ni; ++iter) {
    auto t0 = Time::now();
    infer_request.Infer();
    auto t1 = Time::now();
    fsec fs = t1 - t0;
    ms d = std::chrono::duration_cast<ms>(fs);
    total += d.count();
}

/** Show performance results */
slog::info << "Average running time of one iteration: " << total / static_cast<double>(FLAGS_ni) << " ms" << slog::endl;

if (FLAGS_pc) {
    printPerformanceCounts(infer_request, std::cout);
}
// -----
```

- Step8, Process output, process the result and compare with the label file, the last printf the result and the average inference time.

```
// ----- 8. Process output -----
slog::info << "Processing output blobs" << slog::endl;

const Blob::Ptr output_blob = infer_request.GetBlob(firstOutputName);
auto output_data = output_blob->buffer().as<PrecisionTrait<Precision::FP32>::value_type*>();

/** Validating -nt value */
const int resultsCnt = output_blob->size() / batchSize;
if (FLAGS_nt > resultsCnt || FLAGS_nt < 1) {
    slog::warn << "-nt " << FLAGS_nt << " is not available for this network (-nt should be less than " \
        << resultsCnt+1 << " and more than 0)\n" << " will be used maximal value : " << resultsCnt;
    FLAGS_nt = resultsCnt;
}

/** This vector stores id's of top N results */
std::vector<unsigned> results;
TopResults(FLAGS_nt, *output_blob, results);

std::cout << std::endl << "Top " << FLAGS_nt << " results:" << std::endl << std::endl;

/** Read labels from file (e.x. AlexNet.labels) */
bool labelsEnabled = false;
std::string labelFileName = fileNameNoExt(FLAGS_m) + ".labels";
std::vector<std::string> labels;

std::ifstream inputFile;
inputFile.open(labelFileName, std::ios::in);
if (inputFile.is_open()) {
    std::string strLine;
    while (std::getline(inputFile, strLine)) {
        trim(strLine);
        labels.push_back(strLine);
    }
    labelsEnabled = true;
}
}
```

4. Now, we are clear about the operations executed in the application, next, let us run the executable file we generated before.
5. Enter “`cd \`

`/opt/intel/2019_r1/opencvino/deployment_tools/inference_engine/samples\
/my_build/intel64/Release`” to switch the directory to application folder.

3.5 Advanced Experiment

1. In the previous steps, we already know how to convert the model to IR, and how to make executable files which can be used by the inference engine. Next, let's make a new demo.
2. Since the IR files have been generated already, no need to regenerate it, we continue to use the previously generated squeezeNet1.1.xml and the corresponding bin file.
3. Enter `cd /opt/intel/2019_r1/opencvino/deployment_tools/inference_engine/samples` to switch the workspace to Inference Engine samples folder.
4. Enter `cp -r my_classification_sample my_demo` to copy the files generated in the previous experiment, and we will modify them to be used in my_demo.
5. Enter `cd my_demo` to switch to the new copied samples folder.

```

root@terasic: /opt/intel/2019_r1/opencvino/deployment_tools/inference_engine/samples

0.5,
        cv::Scalar(0, 0, 255));

//----- picture display -----
cv::imshow("Detection results", frame);
const int key = cv::waitKey(1000);
if (27 == key) // Esc
    break;
}
}

```

➤ Step12, After the modifying, save it as main.cpp.

8. Enter “`cd /root/inference_engine_samples_build/`” to go to the sample build folder.

```

root@terasic: /opt/intel/2019_r1/opencvino/deployment_tools/inference_engine/samples
adata::gedit-position not supported

demo/ir/FP16/squeezenet1.1/squeezenet1.1.xml

```

14. The results are as below:

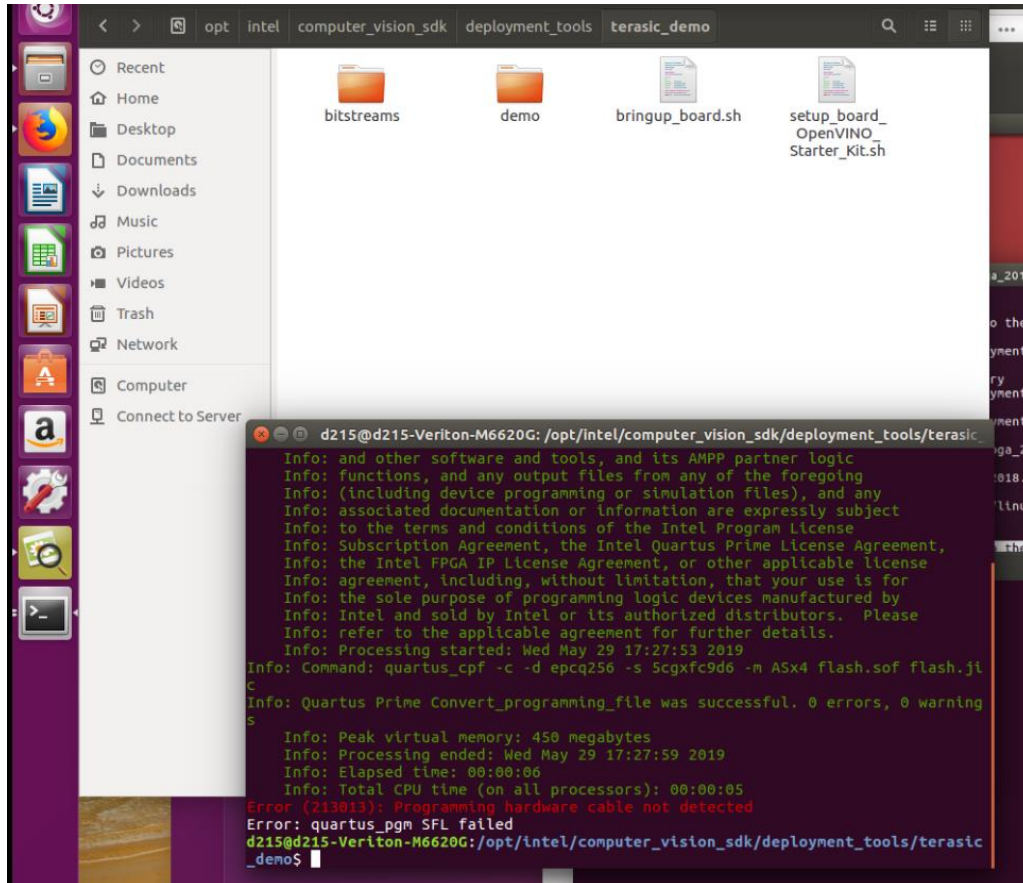

If you test all of these demos successfully, you will find the result is the same as demo 07_classification_pic_loop.sh.

FAQ

1. **Q:** When executing `./bringup_board.sh` command, it reports “Error (213013): Programming hardware cable not detected Error: quartus_pgm SFL failed” as the picture below:

A: Please make sure the USB cable is connected to the UB2 (USB Blaster II) port correctly (the UB2 port is shown in the following picture).

Using the command “lsusb” to double check if the PC detects the hardware or not.

2. **Q:** Which Nets can the OpenVINO Model Optimizer support?

A: Please refer to Intel website:

https://docs.openvino toolkit.org/latest/docs_MO_DG_Deep_Learning_Model_Optimizer_DevGuide.html for the more information.

So far, we have tested GoogleNet V2 and ResNet.

3. **Q:** How to program different aocx file for one FPGA board?

A: Please refer to below command:

```
aocl program acl0 <terasic_demo path>/bitstreams/<board name>/<aocx name>
```

User needs to enter the right **terasic_demo path**, **board name** and **aocx name** to the command, for example, we use DE5a-Net-DDR4 board, we provide below aocx files for DE5a-Net-DDR4:

```

quartus_18.1_pro
  dla_2x2x16x64_fp16_sb10000_i1_actk8_poolk8_owk8_image224x224x4096_clamp8.aocx
  dla_2x3x16x64_fp11_sb10000_i1_actk8_poolk8_normk8_owk8_image224x224x4096.aocx
  dla_2x3x16x64_fp11_sb10000_i1_actk8_poolk8_owk8_image224x224x4096_clamp8.aocx
  dla_2x4x16x64_fp11_sb4096_i1_actk8_poolk8_normk8_owk8.aocx
  dla_8x48_fp16_sb11480_i1_actk4_poolk4_normk2_owk2_image300x300.aocx
  dla_16x16_fp16_sb12768_i1_actk8_poolk8_owk4_image224x224x4096_elu8.aocx
  dla_16x32_fp11_sb12768_i1_actk8_poolk8_owk4_image224x224x4096_elu8.aocx
  dla_16x48_fp11_sb5740_i1_actk4_poolk4_normk2_owk2_image224x224x4096.aocx
  dla_16x48_fp11_sb15000_i1_actk8_poolk8_owk4_image224x224x4096_clamp8.aocx
de5a_net_ddr4

```

Below is the command that we use to program one aocx file:

```
aocl program acl0 /opt/intel/2019_r1/openvino/deployment_tools/terasic_demo/bitstreams/de5a_net_ddr4/dla_16x48_fp11_sb15000_i1_actk8_poolk8_owk4_image224x224x4096_clamp8.aocx
```

4. **Q:** After entering the command “./my_classification_sample -i \

```
/opt/intel/2019_r1/openvino/deployment_tools/terasic_demo/demo/pic_video/car.png \
```

```
-m /opt/intel/2019_r1/openvino/deployment_tools/terasic_demo/\
```

demo/my_ir/squeezenet1.1.xml -d “HETERO:FPGA,CPU”” to execute the Inference Engine, why does it report the error “Cannot find plugin for device: Default”?

```

root@osk: /opt/intel/2019_r1/opencvino/deployment_tools/inference_engine/samples/my_demo

CMake Warning (dev) at my_demo/CMakeLists.txt:29 (Add_executable):
  Policy CMP0037 is not set: Target names should not be reserved and should
  match a validity pattern. Run "cmake --help-policy CMP0037" for policy
  details. Use the cmake_policy command to set the policy and suppress this
  warning.

  The target name "'my_demo'" is reserved or not valid for certain CMake
  features, such as generator expressions, and may result in undefined
  behavior.
  This warning is for project developers. Use -Wno-dev to suppress it.

CMake Error at my_demo/CMakeLists.txt:33 (set_target_properties):
  set_target_properties called with incorrect number of arguments.

-- Configuring incomplete, errors occurred!
See also "/root/inference_engine_samples_build/CMakeFiles/CMakeOutput.log".
See also "/root/inference_engine_samples_build/CMakeFiles/CMakeError.log".

```

Q: There may be syntax errors in the CMakeLists.txt file you have modified. Please double check the syntax (especially the syntax of symbols) in the code you added and correct it. And we also suggest you to double check the syntax in the main.cpp file you modified to prevent errors after entering “make -j8 my_demo” to compile the application program.
